

Installation Instructions

Ducati

Clutch Slave Cylinder CLU-1260

Enclosed:

- 1 off fully assembled clutch slave unit
- 2 off sealing washers
- 3 off M6 x 30 bolts

Use only Ducati recommended fluid.

Preparation:

Before installing your new purchase please read and understand these instructions fully and make sure you have the following items to hand, including a suitable catch vessel and some approved clutch fluid which must be used in accordance with the manufacturer's instructions.

Installing the Slave Cylinder:

1. Remove any fairing (where necessary) to ensure entire area is easily accessible. The bike will need to be held upright or slightly away from the side stand to assist the escape of air bubbles.
 2. Have a cloth wrapped around the existing clutch body when loosening (but not removing) the banjo bolt to minimise the spread of fluid. When loosening the bolt ensure your catch vessel is in place for any escaping fluid. Remove the existing cylinder from the engine keeping the clutch line and original cylinder together while completely wrapped in cloth.
 3. Once the new slave cylinder is attached to the bike (ensuring great care is taken when attaching) it can be completely filled with clutch fluid. The pipe and banjo bolt can be removed from the original cylinder and attached to the new one. Do this as quickly and safely as possible to curb later bleeding times. When attaching the banjo bolt to the new slave cylinder be also sure to use the sealing washers provided to reseal the connection.
 4. Bleed the system through the original bleed valve at the top of the slave cylinder ensuring a pipe is attached and leading to the catch vessel. Apply approximately six pulls on the clutch lever (holding the lever in on the last stroke). Loosen the valve to release the fluid's pressure and tighten before releasing the lever. Repeat this until the clutch no longer feels 'spongy'. Also ensure the clutch reservoir levels do not drop low and draw in air.
- Installation is complete and you may now enjoy the benefits of your new Oberon clutch slave cylinder. The clutch at first will feel light due to the increased efficiency but it won't take long to adjust to the effortless and smoothness of the new clutch system.

WARNINGS

- Do NOT push against the piston once the cylinder is filled, fluid will be ejected and may cause injury.
- Do NOT attempt to operate the slave cylinder whilst removed from the engine.
- Use of the slave cylinder whilst not on the engine will damage the piston/seals and invalidate your warranty.

Product diagnosis in the event of a suspected leak or failure.

1. How often are you refilling the clutch master cylinder?
2. Oil leaks? Check whether it is gearbox, chain or hydraulic oil.
3. Ensure the pressure plate bearing is running freely – taking care to ensure the pushrod is NOT being 'driven'.
4. The seals are manufactured from special materials and purposely machined as a hydraulic seal. Therefore they have an extremely long life and very rarely need replacement (unlike common 'O' rings or inferior seals).
5. Please contact admin@oberon-performance.co.uk for further guidance where needed.
